### Early detection of breast cancer by mammography screening

The numbers below refer to women aged 50 years and older* who either did or did not participate in mammography screening for approximately 11 years.

<table>

<td>-</td>
<td>5</td>
</tr>
</tbody>
</table>

*A few of the studies looked at women aged 40 years and older; these data are also included.

**Short summary:** Mammography screening reduced the number of women who died from breast cancer by 1 out of every 1,000 women. However, it had no effect on the number of women who died of any type of cancer. Among all women taking part in screening, some women with non-progressive cancer were overdiagnosed and received unnecessary treatment.
